

SAP GUI 6.20 (Compilation 5) Release

If you have administrative rights in Windows NT, 2000, and XP Professional, the SAP GUI 6.20 (Compilation 5) CD includes everything you need to install the new SAP GUI that will be required for AASIS logon after December 10, 2003. In addition to the new SAP GUI itself, the CD includes several files to assist you with installation, including:

- [Setup Documentation.htm](#) explains the differences between SAP GUI installation options and provides links to more detailed technical information about the installation process.
- [Default Install.bat](#) installs the SAP GUI using the default settings for the AASIS/SAP system. This is the preferred installation method. Selecting this installation option means you will not be prompted for any subsequent choices in the installation process, which will take fifteen to thirty minutes.
- [CD Install.bat](#) performs a “bare bones,” manual installation, requiring you to select the appropriate settings and to copy the INI file to your system.
- [CD Install.htm](#), located in the DOCS\ folder on the CD, provides step-by-step instructions in support of the CD_Install.bat.
- [Setup.htm](#), located in the GUI\WINDOWS\WIN32\ folder on the CD, links to a web page entitled “SAP Front-end Setup for the Windows Environment.” This web page provides informative links about a number of installation options.
- [Assorted PDF files](#), located in the DOCU\ folder on the CD, offer very detailed technical information about SAP Front-End Installation.
- [Saplogviewer.bat](#) is a post-install step that verifies installation by interrogating the installation file (sapsetup.log) created during install.
- [Uninstall.bat](#), obviously, uninstalls the SAP GUI.

Should you need assistance with your SAP GUI installation efforts, please contact the AASIS Help Desk at (501) 683-2255.

The AASIS Support Center wishes to thank you for your crucial assistance in completing this important upgrade.
